Only when she moved to the sixties of her life she began to get herbs from medicinal herbs and use them. Over time, Susan Weissman continued to expand her knowledge of plants. She loved listening to other people's testimonies about how the plants helped them and felt that God was inspired to deal with herbs. Susan Weissman wrote in an easy way how medicinal herbs are used, which plants are good for the liver, how to take hearts for the heart, which plants should be taken for the eyes, which for the kidneys, or thyroid disorder. And people were eager to know about the great benefits that nature brings, which has no negative side effects.

Homeopathy is a complete medical system, developed in Germany in the XIX century. Its founder is German Hahneman Samuel Christian Friedrich (10.4.1755 - 2.7.1843), physician, chemist, polyglot and philosopher of nature and its laws. He applies the principle that "similar to the same lens", introduces minimum doses of treatment, gives the patient a single dose, prepares homeopathic remedies by diluting them in aqueous and alcoholic solution to the level that no molecule is contained in it, between each subsequent stroke dilution In order to determine the true homeopathic medicinal product, it is introduced to take into account the specificity of each patient and his inheritance, genetic code, and his / her inheritance. All the features (healthy and sick) of the treated person (holistic approach). For over 220 years homeopathic remedies do not lose their effectiveness.

Chiego, Jr. D. J. (2014). *Essentials of Oral Histology and Embryology, 4th Edition, A Clinical Approach*. Maryland Heights, Missouri, United States: Mosby Publishing.

The fourth revised edition of *Basic and Oral Histology and Embryology* is a unique, comprehensive and richly illustrated textbook, containing basic knowledge in histology and embryology, but detailed information on the latest achievements, especially in the section on the oral cavity. Compared to the previous two editions, this edition contains a large number of new papers related to authors, scope and content of textures, literature and design. The book is intended primarily for students of dentistry, but also for students of medicine, veterinary medicine, pharmacy and biology. The entire material is divided into 16 chapters containing the following thematic units: basic histological methods, microscopy, didactic approach to material analysis, cells with chemistry of biomolecules and medical cytology, basic characteristics of tissue cells and organ system, general embryology, tissue (epithelial, connective, muscular and nervous) and organ systems. The material is systematized in such a way that within each chapter, in addition to the basic text, which in the didactic way deals with the morphological and main functional characteristics of histological structures, there are additional data from the latest world literature on ultrastructure and molecular organization (on gray basis), physiological mechanisms (on an orange background), embryology - general embryology, histogenesis and organogenesis (on a yellow background) and clinical significance (on a blue basis). The materials in the field of histology and embryology of the oral cavity, contained in Chapter 3 are described in detail. It includes all the teaching units necessary for dentistry students: basic anatomical characteristics of the head and bones, general characteristics, division and contents of the oral cavity, salivary gland, oral mucosa, general characteristics of the tooth, pulp-dentine complex, cement, periodontium, alveolar extension of the jawbone and the embryology of all the structures of the oral cavity. This chapter also contains basic information on the most common disorders of all structures of the oral cavity, with special attention being paid to the congenital anomalies of the craniofacial region (cleft palate). This chapter also describes the stem cells of the teeth, which today arouse great interest, given the possibility that the lost teeth and tissues of the craniofacial region are repaired and regenerated by the application of stem cells and tissue engineering.

The text is documented with over 500 light microscopic, electron microscopic and macroscopic photographs, drawings, tables and diagrams. The original or modified drawings are, in most cases, colored so that each cell, tissue, or organ is painted in the color of the leaf originating from the leaf origin: the cells of ectodermic origin are colored with the nuances of blue, endodermic yellow cells with yellow, while the cells the mesodermal origin is colored with red shades. This way of presenting the drawings is aimed at pointing students to the embryonic origin of histological structures during the shuffling of histology material. The novel in this edition is a new part that contains questions and answers from the theoretical and practical part of histology and embryology. In the book Basic and Oral Histology and Embryology, the rich experience of the author was embedded, which resulted from their many years of pedagogical and scientific research work.
